## Phishing Simulation & Response Plan

PS/2021/103  
K.G.R. KAVEESHA

## 1. Phishing Email Example

**Subject:** Password Expiry Notice – Action Required Immediately

**From:** IT Support [it-helpdesk@secure-it-support.com](mailto:it-helpdesk@secure-it-support.com)

**Message:**

Dear User,

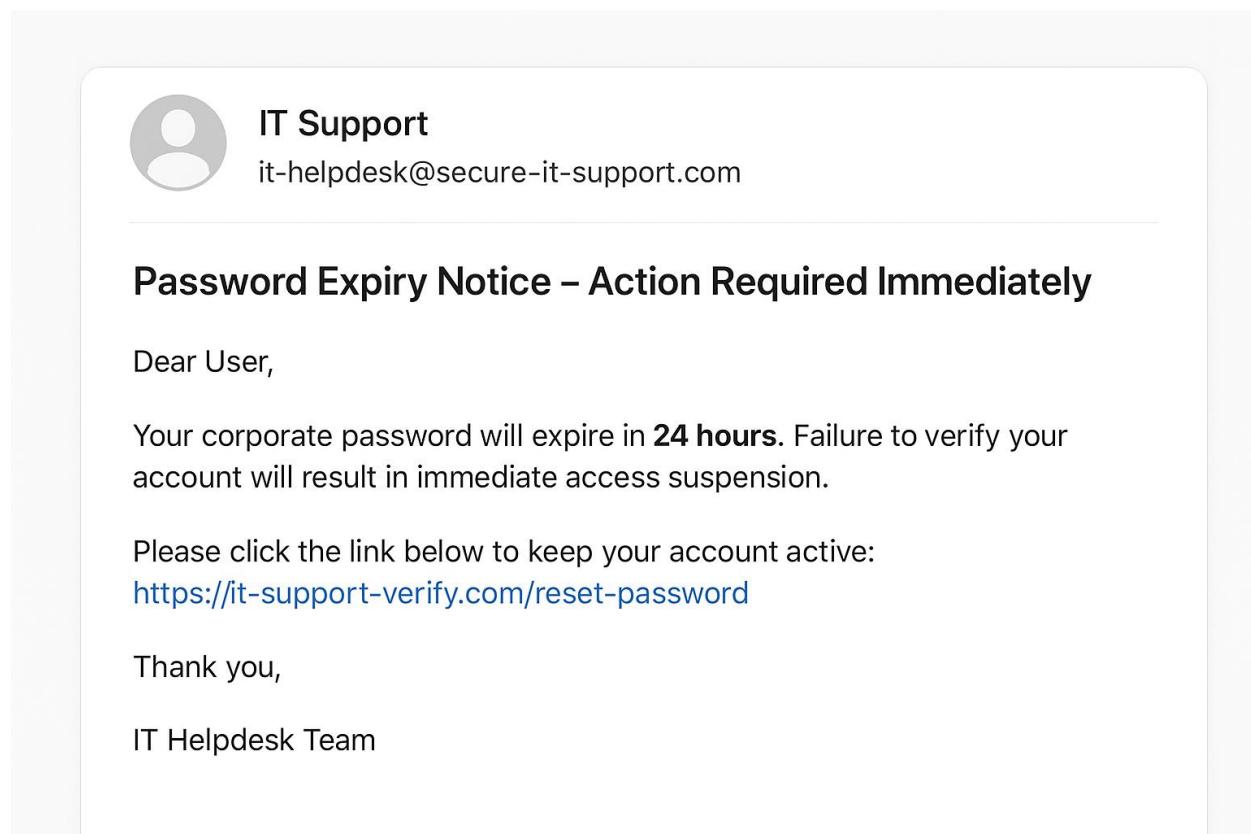

Your corporate password will expire in **24 hours**. Failure to verify your account will result in immediate access suspension.

Please click the link below to keep your account active:

<https://it-support-verify.com/reset-password>

Thank you,

IT Helpdesk Team

The image shows a simulated email message from 'IT Support' at 'it-helpdesk@secure-it-support.com'. The subject line is 'Password Expiry Notice – Action Required Immediately'. The message body contains a warning about a password expiring in 24 hours and a link for account verification.

**IT Support**  
it-helpdesk@secure-it-support.com

**Password Expiry Notice – Action Required Immediately**

Dear User,

Your corporate password will expire in **24 hours**. Failure to verify your account will result in immediate access suspension.

Please click the link below to keep your account active:  
<https://it-support-verify.com/reset-password>

Thank you,

IT Helpdesk Team

## 2. Identify Red Flags

| Red Flag                  | Description  | Risk Level |
|---------------------------|--|------------|
| Urgent / Fear Tactic      | Message threatens account suspension within 24 hours to induce panic clicking.                               | High       |
| Suspicious Sender Domain  | “secure it support.com” does not match the organization’s real domain.                                       | High       |
| Generic Greeting          | Uses “Dear User” instead of recipient’s name.  | Medium     |
| Fake Reset Link           | URL “it support-verify.com” does not match real corporate IT domain; resembles a credential harvesting site. | High       |
| Grammar/Formatting Errors | Minor issues such as inconsistent spacing and tone reduce legitimacy.  | Low        |
| Sender Display Name Trick | “IT Support” is generic and can be easily spoofed.   | Medium     |

## 3. Email Header Analysis

From a typical phishing header found in email security labs.

```
Return-Path: <mailserver@randomhost.xyz>
From: IT Support <it-helpdesk@secure-it-support.com>
Received: from unknown123.randomhost.xyz (185.32.55.21)
Authentication-Results: spf=fail; dkim=none; dmarc=fail
Message-ID: <98374hgfh8374@randomhost.xyz>
```

| Header Field                            | Explanation  | Relevance to Authenticity   |
|---|--|---|
| From: vs Return-Path                    | “From” claims to be IT Support, but “Return-Path” shows randomhost.xyz.  | Mismatch indicates spoofing. Legitimate emails rarely come from unrelated servers.        |
| Received: Path                          | Shows the email originated from 185.32.55.21, a foreign, unknown server. | Indicates sender infrastructure is not part of the organization. Helps trace true origin. |
| Authentication-Results (SPF/DKIM/DMARC) | SPF=fail, DKIM=none, DMARC=fail.   | Clear indication that sender failed authentication checks and is likely malicious.        |
| Message-ID Domain                       | Message ID references randomhost.xyz, not the corporate domain.          | Another sign email was generated outside legitimate mail servers.                         |

## Conclusion

All header checks strongly support that the message is spoofed and malicious.

### 4. Incident Response Plan

1. **Threat Description:** This is a credential theft phishing attack. The attacker attempts to trick users into clicking a fake password reset link to harvest login credentials to corporate systems.
2. **Potential Impact Assessment:** If a user clicks the link and enters credentials
  - o Unauthorized access to corporate email or internal systems
  - o Data theft or exfiltration
  - o Account takeover
  - o Lateral movement within the network
  - o Potential deployment of malware or ransomware
  - o Compromise of sensitive business information
3. **Immediate Response Actions:** For the SOC / Helpdesk
  - o Alert the security team and log into the incident
  - o Advise recipients NOT to click the link, issue a companywide warning
  - o If someone clicks the link: reset their account passwords immediately, invalidate active sessions, Review authentication logs for suspicious login attempts
  - o Block the phishing domain and IP at the firewall, proxy, and email filters
  - o Report domain to web hosting and threat intelligence services

### 4. Preventive Actions

#### Technical Controls

- o Enforce SPF, DKIM, and DMARC for all corporate email
- o Enable advanced email filtering: sandboxing, URL rewriting, attachment scanning
- o Deploy endpoint protection with anti-phishing and anti-malware capabilities

#### User Awareness

- o Quarterly phishing awareness training
- o Teach staff to identify red flags: suspicious domains, urgencies, generic greetings
- o Simulated phishing exercises to reinforce safe behavior
- o A “Report Phishing” button in the email client

### 5. Future Recommendations

- o Establish a formal Email Security Policy
- o Implement continuous monitoring of email gateways and security logs
- o Enforce least-privilege access to reduce account takeover impact
- o Regular audits of password policies and authentication logs
- o Maintain an updated incident response playbook for email-based threats
